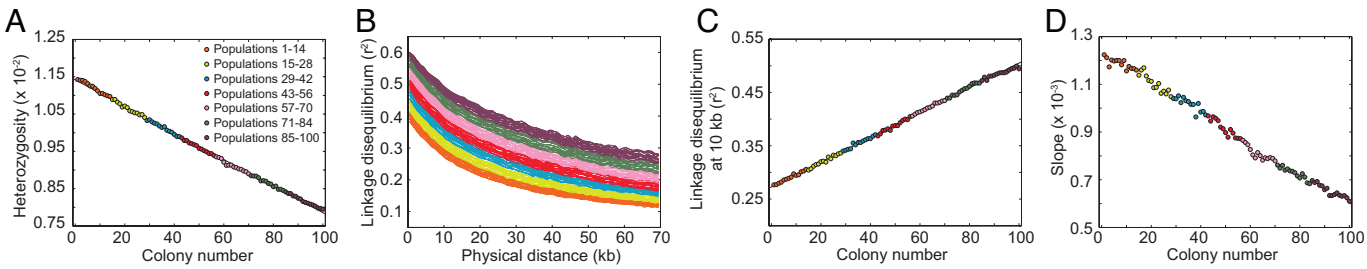

Fig. S1. Patterns of heterozygosity, LD, and the ancestral allele frequency spectrum in simulations of the serial founder model with symmetric migration at rate $M = 1$ between neighboring populations. All other parameters are the same as in Fig. 3.

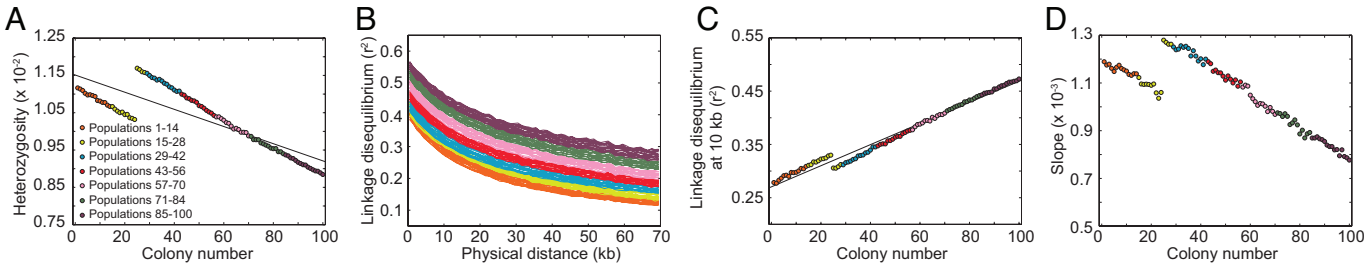

Fig. S2. Patterns of heterozygosity, LD, and the ancestral allele frequency spectrum in simulations of the serial founder model with archaic admixture. The model incorporates archaic admixture with an admixture fraction $\gamma = 0.1$ of population 25 deriving from the archaic population. All other parameters are the same as in Fig. 3.

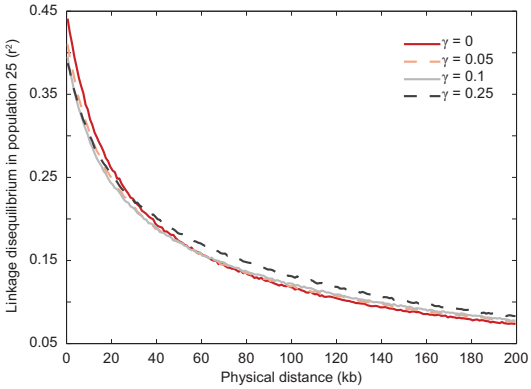

Fig. S3. LD (r^2) as a function of physical distance for population 25 in the serial founder model with archaic admixture at rate γ. The simulation proceeded in the same way as in Fig. 5, except that longer regions were simulated (1 Mb).

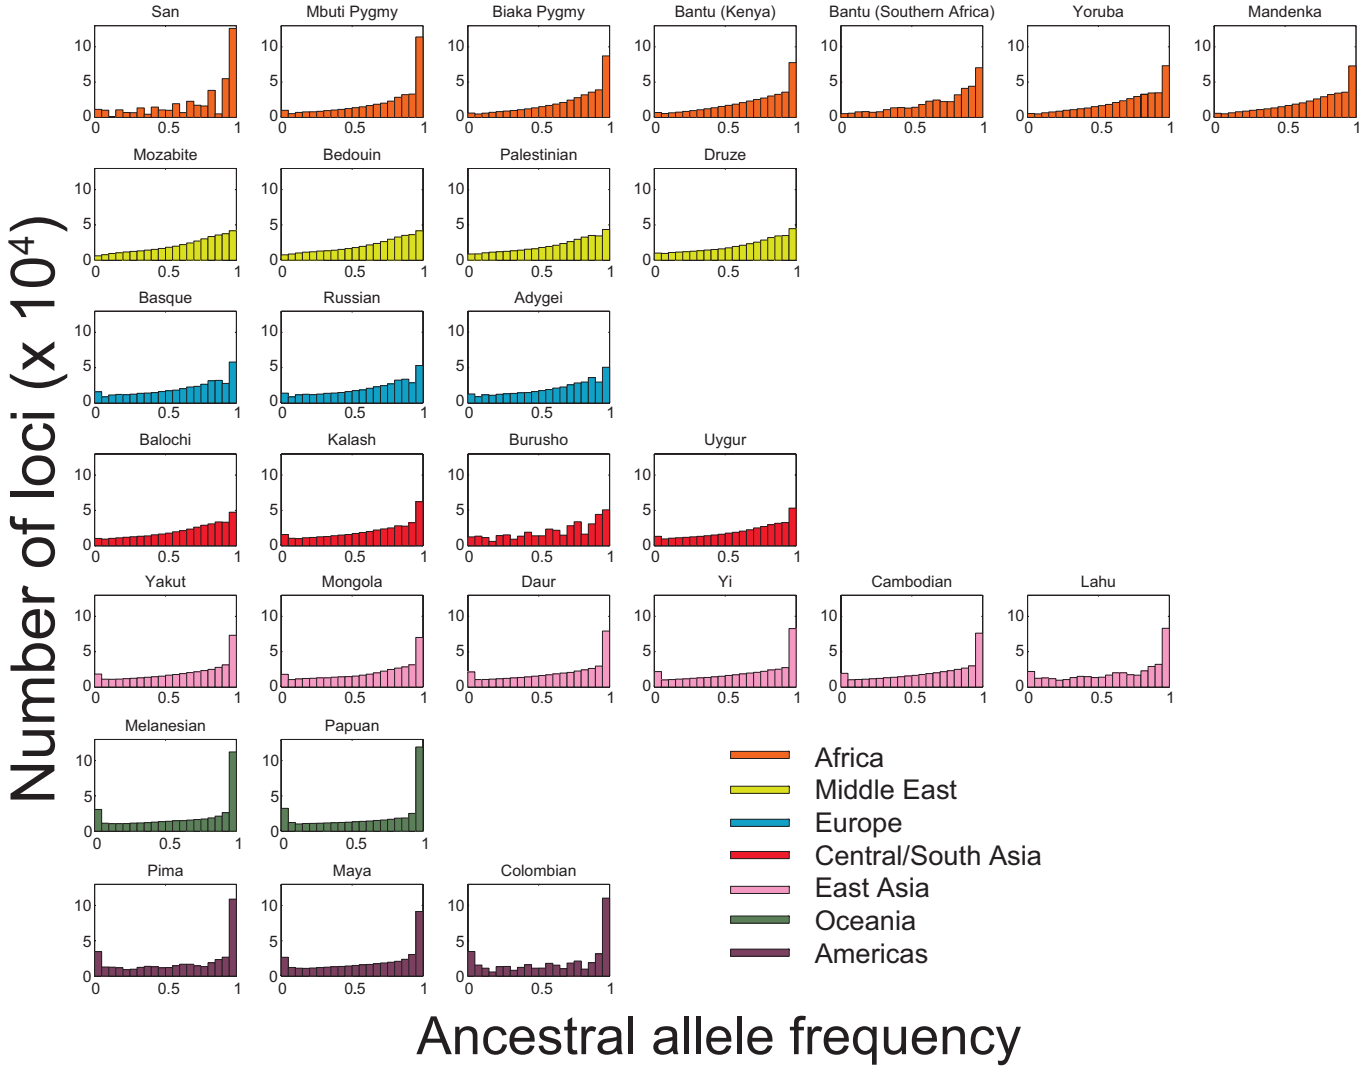

Fig. S4. Ancestral allele frequency spectra calculated using a resampling technique applied to the data of Jakobsson M, et al. (2008) *Nature* 451:998–1003.

MS commands for simulating population-genetic models

Basic model

The code below will run 5000 simulations of a basic serial founder model. There are $K = 100$ populations, each of diploid size $N = 10,000$ individuals, each with a sample of $n = 50$ chromosomes. The first founding event occurs at time $t_D = 2,079$ generations ago (51.975 kya). The bottleneck size is $N_b = 250$ individuals and the bottleneck length is $L_b = 2$ generations. The interval of time between a population expansion and the next founding event is $L = 19$ generations. The population mutation rate is $\theta = 4N\mu = 10$ and the population recombination rate is $\rho = 4Nr = 10$. The sequence length is 100,000 bases (100 kb). If t is a length of time in generations, then the coalescent time unit used here is $t/(4N)$.

Migration

The code below will run 5000 simulations of a serial founder model with migration between neighboring populations. There are $K = 100$ populations, each of diploid size $N = 10,000$ individuals, each with a sample of $n = 50$ chromosomes. The first founding event occurs at time $t_D = 2,079$ generations ago (51.975 kya). The bottleneck size is $N_b = 250$ individuals and the bottleneck length is $L_b = 2$ generations. The interval of time between a population expansion and the next founding event is $L = 19$ generations. The population mutation rate is $\theta = 4N\mu = 10$, the population recombination rate is $\rho = 4Nr = 10$, and the population migration rate is $M = 4Nm = 40$. The sequence length is 100,000 bases (100 kb). If t is a length of time in generations, then the coalescent time unit used here is $t/(4N)$. Migration parameters are in red.

Archaic admixture

The code below will run 5000 simulations of a serial founder model with archaic admixture. There are $K = 100$ populations, each of diploid size $N = 10,000$ individuals, each with a sample of $n = 50$ chromosomes. The first founding event occurs at time $t_D = 2,079$ generations ago (51.975 kya). The bottleneck size is $N_b = 250$ individuals and the bottleneck length is $L_b = 2$ generations. The interval of time between a population expansion and the next founding event is $L = 19$ generations. The archaic population (population 101 below) has size $N_A = 1,000$ individuals. The archaic population diverges from the modern population $t_D^A = 16,000$ generations ago (400 kya). The admixture occurs in population 25 at time $t_{Admix} = 1584.5$ generations ago at rate $\gamma = 0.05$. The population mutation rate is $\theta = 4N\mu = 10$ and the population recombination rate is $\rho = 4Nr = 10$. The sequence length is 100,000 bases (100 kb). If t is a length of time in generations, then the coalescent time unit used here is $t/(4N)$. Admixture parameters are in red.

Archaic persistence

The code below will run 5000 simulations of the archaic persistence model. There are $K = 100$ populations, each of diploid size $N = 1,000$ individuals, each with a sample of $n = 50$ chromosomes. The populations diverge $t_D = 40,000$ generations ago (one million years ago). The first wave (from population 1 to population 2) begins 2,079 generations ago (51.975 kya). The interval of time between the end of one wave and the start of the next wave is 19 generations, and each wave lasts for $L_w = 2$ generations. Therefore, the wave from population k to population $k + 1$ starts $t_k = 2,079 - 21(k - 1)$ generations ago. The population mutation rate is $\theta = 4N\mu = 1$, the population recombination rate is $\rho = 4Nr = 1$, and the population migration rate is $M = 4Nm = 0.1$. During the migration wave the population migration rate increases to $W = 4Nw = 1000$. The sequence length is 100,000 bases (100 kb). If t is a length of time in generations, then the coalescent time unit used here is $t/(4N)$.

Instantaneous divergence

The code below will run 5000 simulations of the instantaneous divergence model. There are $K = 100$ populations, with diploid size N_k individuals for population k. Each population has a sample of $n = 50$ chromosomes. The populations diverge $t_D = 2,079$ generations ago (51.975 kya). The population mutation rate is $\theta = 4N\mu = 10$ and the population recombination rate is $\rho = 4Nr = 10$. The sequence length is 100,000 bases (100 kb). If t is a length of time in generations, then the coalescent time unit used here is $t/(4N)$.

```
./ms 5000 5000 -t 10 -r 10 100000 -I 100 50 50 50 50 50 50 50 50 50 50 50 50 50 50 50 50 50 50 50 50 50 50 50 50 50 50 50 50
